MANAGEMENT OF VIRAL LOAD RESULTS IN INFANTS, CHILDREN, ADOLESCENTS, AND ADULTS

* Due to their high genetic barrier, resistance to DTG and PIs develops very slowly. An elevated VL on DTG or LPV/r is therefore more likely to be related to suboptimal adherence. For this reason, a client should be on DTG or LPV/r for at least 2 years before considering a switch to second-line.

*Clients who have persistent low grade viraemia of between 50 - 999 c/mL should be discussed with one of the helplines listed below on a case-by-case basis. If the client is still on an NNRTI based regimen, a single drug switch to DTG can be considered as outlined in the switching algorithm on page 40

If in doubt about any aspect of viral load management or switching to second-line, contact one of the following resources:

- National HIV & TB Health Care Worker Hotline: 0800 212 506
- Right to Care Adult HIV Helpline: 082 957 6698
- Right to Care Paediatric and Adolescent HIV Helpline: 082 352 6642
- KZN Paediatric Hotline: 0800 006 603

For the management of an elevated VL in a pregnant woman, see page 79
