**What is Coronavirus?**

Coronaviruses are large groups of viruses that are common among animals. These viruses can make people sick, usually with a mild to moderate upper respiratory tract illness. Similar to SARS, a new coronavirus called COVID-19 was identified in China and is associated with an outbreak ofViehpathogenicity.

**What is COVID-19?**

Coronavirus (COVID-19) is a new virus disease caused by the most recently discovered coronavirus. This new virus is declared dangerous because it causes infections that lead to lung infections, and this can spread from person to person very easily. There is an outbreak of COVID-19 virus worldwide.

**Is there a vaccine, drug or treatment for COVID-19?**

No, it is not yet known if there is a specific vaccine or antiviral medicine to prevent or treat COVID-19.

**What are the symptoms?**

Most people infected with the COVID-19 virus experience fever, cough, fatigue, myalgia (general muscle weakness), fever, difficulty breathing. Note that the virus that causes COVID-19 can cause other symptoms, so it is important that you get medical care for any serious symptoms, especially if you have been in contact with someone who has COVID-19.

**How does COVID-19 spread?**

The COVID-19 virus is spread through respiratory droplets when a person coughs or sneezes. These droplets are highly transmitted through respiratory contact such as touching or shaking hands, or touching an object or surface with the virus on it, then touching your mouth or nose before washing your hands. Because the virus is transmitted through the droplets it is very important to stay at least 1.5m from others when you are sick.

**What are the symptoms?**

Some people with COVID-19 present no symptoms, while others may only experience mild symptoms. Symptoms can range from mild to severe, but some people with COVID-19 experience severe symptoms.

**Who is at risk?**

Anyone can be infected with COVID-19, but some people are at higher risk of serious illness. These include:
- People with heart or lung disease
- People with diabetes
- People with kidney disease
- People with cancer
- People with liver disease
- People who are older
- People who are pregnant

**What is the incubation period for COVID-19?**

The incubation period is the period of time between when the virus enters the body and when symptoms start. The incubation period of COVID-19 is believed to be 2 to 14 days, but most often it is 5 to 7 days. The incubation period of COVID-19 is believed to be 2 to 14 days, but most often it is 5 to 7 days.

**What do I do if I suspect I have COVID-19?**

If you suspect you have COVID-19, please call your primary health care provider for instructions on what to do. They will provide guidance on whether you need to be tested and what precautions you should take.

**What is the most effective method to prevent COVID-19?**

The most effective method to prevent COVID-19 is through frequent handwashing and maintaining a safe distance from others. If you are symptomatic, please stay at home and do not multiply harmful diseases. If you have symptoms of COVID-19, please seek medical attention immediately.

**Can I wash my hands with soap and water?**

Yes, washing your hands with soap and water is very important for preventing the spread of COVID-19. Make sure to wash your hands frequently with soap and water for at least 20 seconds, especially after going out and before eating.
